# the logic
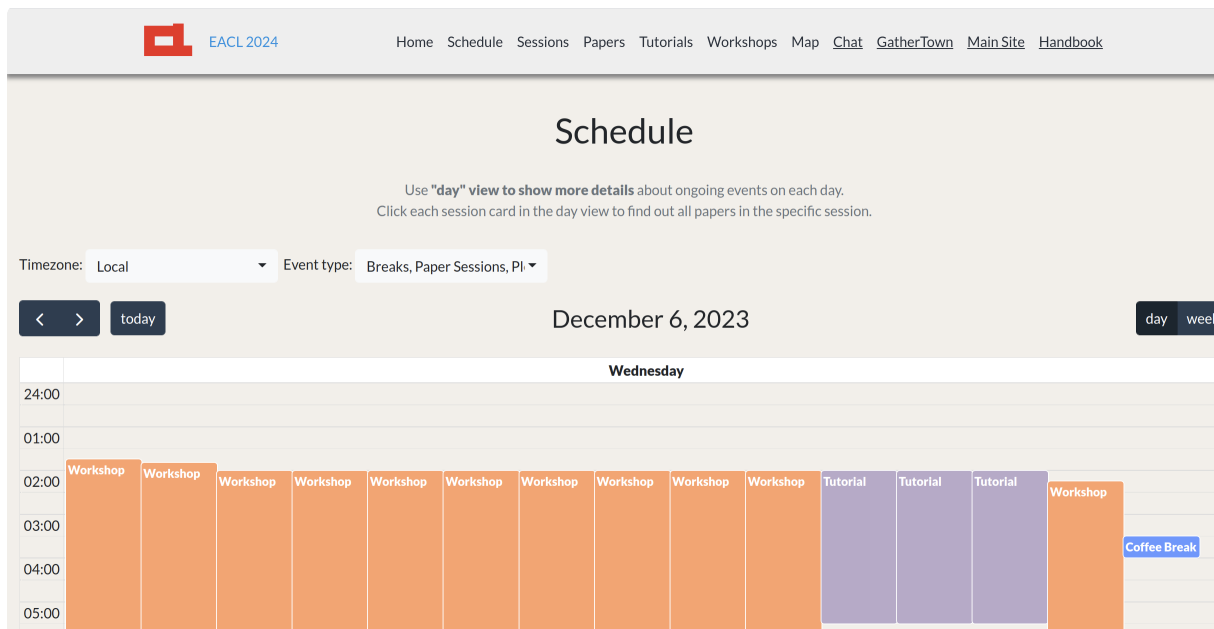

What happened when runing the EACL system?

- When starting to run the main.py, it
    - prepares the data from conference.json (data/data/conference.json), including
        - conference (line 299 in main.py)
        - site_data
        - by_uid
    - wraps the datas in extra_files, and pass it to index.html (default page)
    - in index.html page, the model uses the passed extra_files to initializes different subpages (navigations). Taking schdule.html as an example, this page first initializes the cal_head.html (line 7 in schedule.html), which is responsible for the layout in schedule page:

    - In the cal_head.html, it initializes the calendar div (defined in schedule.thml, line 32) with a FullCalendar object, and filled out this calendar object with the passed data extra_files.
        - So, if we want to adjust the layout, we need to do something for the calendar object. And you can find the API of this calendar in https://fullcalendar.io/
        -
